Experiment 6 FAQs

Frequently Asked Questions:

1. What is Queue?

Ans: Queue is a linear data structure in which data can be inserted from rear end and deleted from front end.

2. How is the queue represented?

Ans: Queue can be represented using array and linked list.

3. Enlist types of queues.
   1)Linear queue 2) Circular queue 3) Priority queue etc.

4. What is the concept of a circular queue?

Ans: .In a circular queue the last node is connected back to the first node to make a circle.

5. Applications of Queue.

Ans: 1)categorizing the data 2)Queue simulation

6. What is the priority queue?

Ans: A priority queue is a collection of elements where each element is assigned a priority and the order in which elements are deleted and processed is determined from the following rules:

1. An element of higher priority is processed before any element of lower priority.
2. Two elements with the same priority are processed according to the order in which they are added to the queue.

7. What is Deque?

Ans: The term deque is a contraction of double-ended –queue.

It is a linear list in which elements can be added or removed at either end but not in the middle
